Wilson - Iterate

Your part: Explain how we find problems, make changes, and check whether they help.

Write 2-3 short bullet points per question in your own words. Use real team examples.

1. **What is one difficulty we found while choosing sensors or trying our prototype?**
   Think back: Did a sensor ever miss the prototype lizard or show a strange reading? What happened?

2. **What change did we make, or could we try, to address that difficulty?**
   Think back: Could we move the sensor, or change a step in the code? What would you try first?

3. **How could we check fairly whether that change makes our prototype better?**
   Think back: What if we moved the prototype lizard the same way several times and counted the correct detections?
